

Technical Memorandum

Significant Nutrient Point Sources in the Baltimore Harbor (Patapsco River Mesohaline) Watershed

The U.S. Environmental Protection Agency requires that Total Maximum Daily Load (TMDL) allocations account for all significant sources of the impairing pollutant or pollutants. The TMDL analysis for Baltimore Harbor addresses the total nitrogen (TN) and total phosphorus (TP) loads for the growing season conditions (May-October) and for average annual conditions. This technical memorandum identifies, in detail, the significant surface water discharges of TN and TP used as modeling input when computing the TMDLs. These are conceptual values that are within the TMDL thresholds. Whereas, actual effluent limits and related permit conditions will be established at the time of permit issuance or renewal through the permit process. The Maryland Department of the Environment (MDE) expressly reserves the right to allocate the loads among different sources using the above mentioned *permit process* in any manner that is reasonably calculated to achieve water quality standards.

Potential waste load allocations have been identified for National Pollutant Elimination System (NPDES)-regulated municipal and industrial wastewater treatment plants (WWTP) and municipal separate stormwater discharges in the Baltimore Harbor watershed. There are two municipal WWTPs contributing nutrient loads to the Baltimore Harbor: the Patapsco WWTP and the Cox Creek WWTP. In addition to these two municipal WWTPs, there are six industrial point sources contributing to the total nutrient loads into the Harbor: International Steel Group (ISG), WR Grace, Erachem-Comilog, US Gypsum, Envirotech and Millenium Specialty. Waste load allocations (WLAs) have been identified for these point sources based on their permitted or actual discharge flows. Potential annual waste load allocations are also identified for five jurisdictions with municipal stormwater discharges in the Baltimore Harbor watershed to address nutrient loads from urban sources during storm events. Baltimore City, Baltimore County, Anne Arundel County, Carroll County and Howard County are all covered under NPDES Phase I stormwater permits. Potential annual waste load allocations have been identified for these stormwater discharges based on the 1995-1997 watershed model. The stormwater nutrient loads account for contributions from urban land. The land use information was based on 1997 Maryland Department of Planning data.

The nutrient reductions for point sources, reflected in the TMDL analysis, are designed to protect water quality in the Baltimore Harbor and the Chesapeake Bay. It is likely, however, that future Chesapeake Bay Agreement nutrient goals may entail more ambitious point source nutrient reductions to protect the water quality of the Bay.

Tables 1a, 1b, 2a, and 2b, below, identify the potential nitrogen and phosphorus allocations attributed to the point sources in the Baltimore Harbor: municipal and industrial WWTPs, and NPDES urban stormwater discharges. Following the approval of the TMDL by EPA in December 2007, changes were made to the list of allocated facilities. As a result of a permit request for the Envirotech facility, the WLA has been adjusted to allow for the discharge from the facility. The revision of the WLA to accommodate the requested load necessitated a

corresponding decrease in a load for another facility. These changes do not affect the overall TMDL calculation or the total WLA for point sources.
